Soft Skills and Traits

Analytical Thinking — Creative Thinking

The natural style of tackling different problems can vary greatly depending on the specific context. This speaks of good overall ability to start untangling challenges from a creative point of view (i.e. applying helicopter view of the big picture) or more detailed and analytical one.

Consider Carefully — Impulsive

When facing unknown situations that involve risk, the result speaks of someone who can be a bit of a chameleon. At times might decide to be cautious, while at others - can come across as a daredevil. It all depends on the overall context and particular setting.

Single Tasking — Multitasking

A natural hybrid. At times prefers to act in an expert capacity that narrows down the vision and scope to what really matters, while at others - has a good capability of performing activities that involve organizing multiple processes, tasks, and people.

Spatial Thinking

High capacity to imagine and visualize how objects can be arranged and rotated and how they could fit together. It is extremely beneficial when it comes to dealing with large amounts of information that require transformation into physical, and visual end products.

Operational Efficiency

Currently demonstrating great capacity in paying attention and ability to retain and recall large amounts of information. Working with complex, verbal information is not a challenge at all. This is a valuable ability that can be used in strategic meetings, when multitasking is required, or when dealing with an environment that distracts others.

Focused Attention

Excellent in being selective and focused on picking up all types of information regardless of the format. From complex presentations and documents with different elements to videos and messaging apps - always on top of the attention game.
